

# Bug Screener

Magnetic Window Screen For Vehicles

Keep Bugs out and Improve Air Flow  
When Sleeping in Your Vehicle

One size fits most vehicles.  
Open for instructions.

## Included in the Bug Screener kit:

- 1 no-see-um mesh window screen (approximately 22 x 40 in./56 x 102 cm.)
- 12 easy-grab neodymium magnets
- 1 heavy-duty plastic zipper bag for storing the screen and magnets

There are two ways to position your Bug Screener: on the outside of your vehicle and on the inside of your vehicle. Regardless of the screen's position, the window itself can be in any state of openness when the screen is being used; that is, it can be rolled down a tiny bit, all the way, or anywhere in between. The dot on each magnet marks the polarity of the magnet and makes it easier to know how to stack the magnets.

## 1. Using the Screen on the outside of the Vehicle

Position the Bug Screener over a window, and place the magnets as needed to hold the screen in place. (See Figure 1). If the window is part of a door that you will be opening and closing while using the Bug Screener, make sure the magnets are attached to the door only and not to the other parts of the vehicle. It may be necessary to fold over the edges of the window screen so they don't get caught in the door when closing it. (See Figure 2).

Figure 1. The screen and magnets placed on the outside of a vehicle. (Note that the magnets are lighter in color to improve visibility in the photos.)

Figure 2. If you will be opening and closing the door with the window screen on it, you may have to fold the edges of the screen under the magnets so the screen won't get caught when the door is being closed.

Figure 3. The screen and magnets placed inside a window frame.

Figure 4. If you can't secure the bottom of the screen with magnets, it is helpful to keep the screen tight between the side magnets and to keep the window rolled up a few inches (8 cm.).

## 2. Using the Screen on the Inside of the Vehicle

This method is easiest to implement when the door is closed and you are sitting inside the vehicle. With the window up, position the screen so that it covers the window, and place the magnets on the edges of the screen so they stick to the metal window frame. (See Figure 3.) You may need to fold the edges of the screen and tuck them under the magnets so they don't get stuck when closing the door.

Note that this method of use is dependent upon the window frame being metal, and therefore it may not work in all vehicles. Also, while the sides and top of many vehicle window frames are often metal, the bottom side is often not, so it will be impossible to secure the screen there with magnets. When this is the case, it is helpful to keep the window up at least a couple of inches (5 centimeters) from the bottom and to keep the bottom of the screen pulled as tautly as possible between the magnets on the sides. (See Figure 4.) This will help prevent bugs from getting into the vehicle.

One benefit of this second method of use versus the first method is that you can roll the windows up and drive with the screen still in place. When you get to your next camp, simply roll the window down again. No further setup is needed. Do this at your own risk, however; the screen may hinder visibility through the window it is covering.

## Storage

When not using the Bug Screener, fold it up and place it and the magnets into the heavy-duty plastic zipper bag that the items came packaged in. Store the bag in your glove compartment, seat-back pocket, or any other convenient place in your vehicle.

Enjoy being bug-free!
